Evidence appendix

1. Fictional MeridianOps

Entirely fictional demonstration. Companies, metrics, sources and probabilities are invented; this is not a live investment recommendation.

Company Overview

Fictional MeridianOps provides software that automates invoice exceptions and approvals for finance teams at mid-sized logistics businesses. It integrates with customer workflows to reduce manual exception handling and improve cash collection. The fictional packet describes a working integration and recurring customer revenue; renewal history is limited to one cycle. The precise subscription pricing is not specified. [D1]

Decision Brief

Weighted score

3.9 / 5

Score coverage: 100% · All rubric weight assessed. Descriptive score; not a return prediction.

PURSUE · Priority: High · Attention: Yes

Specific buyer pain and early use justify focused diligence at this price.

Attention: High-priority PURSUE; Specific buyer pain and early use justify focused diligence at this price.

Commitment readiness: Cannot assess readiness. Commitment has not been assessed; this is a pursuit screening.

Investment Case and Decision

Investment case. MeridianOps sells software that removes a costly, recurring invoice-approval burden for mid-sized logistics finance teams. It has a clear buyer, integrates into existing finance workflows and can show customer time savings. The potential is a focused vertical workflow business with room to expand account value.

Evidence supporting the case. The fictional diligence packet includes recurring customer revenue, measured time savings, a functioning product, positive delivery contribution and reviewed entry terms. The team has relevant operating experience. These facts support focused follow-up in this illustration; the packet and all sources are invented for report testing.

Counterarguments and risks. Retention evidence covers only one renewal cycle, so durable usage and expansion are not established. Sales remain founder-led, acquisition efficiency is unproven at scale, and ERP vendors or adjacent workflow suites could reproduce features. The evidence supports early product value but not a proven category moat or repeatable high-growth engine.

Why this recommendation; what could change it. Pursuit priority reflects the value of further work at the current price and the evidence appropriate to this stage. Focus on the highest-impact customer and delivery questions. This screening does not authorize commitment or require mature operating metrics before a founder meeting.

Next action: Arrange a founder meeting and request customer references.

Seed · Post-money SAFE · EUR 12m cap; modeled expenses 4%, carry 20%.

Market timing: Customers seek faster cash collection and fewer manual exceptions; established workflow vendors remain competitors.

Evidence as of 2026-10-03 (fictional)

Qualitative investment judgment; no personal return hurdle supplied

Seven-Factor Assessment

Category	Weight	Score / 5	Evidence strength	Key driver
Team	25%	4.1	Medium	Relevant operators; delivery capacity remains concentrated
Market	20%	4.0	Medium	Clear buyer pain; workflow suites remain competitors
Product	15%	4.0	Medium	Working integrations and measured customer time savings
Traction	15%	3.8	Medium	Recurring revenue supported; renewal history remains short
Unit Economics	10%	3.7	Medium	Positive delivery contribution; acquisition scaling unproven
Defensibility	10%	3.4	Low	Embedded workflows plausible; data advantage not proven
Terms	5%	4.0	Medium	Transparent costs; valuation leaves illustrative upside

Evidence strength: High = key claims independently corroborated by authoritative evidence; Medium = some corroboration, with material gaps; Low = evidence is mostly reported, incomplete or conflicting; Unknown = evidence quality could not be assessed. Unknown is not a negative score.

Weighted score across scored factors: 3.9 / 5 · Score coverage: 100%. Unscored factors are excluded, not treated as zero; scores are descriptive and do not determine the recommendation.

Team. The fictional founders have finance-software and logistics experience, with two customer references supporting implementation delivery. The planned hiring covers customer success and integrations. Founder-led selling and dependence on one technical lead prevent a higher score; this is acceptable residual execution risk for the illustrated seed stage. [D1]

Market. Customer interviews identify cash-collection friction and manual exception handling as funded problems. The accessible wedge is finance teams in logistics, rather than all global accounts-payable spend. Existing suites can add similar features, so distribution and measurable time savings matter more than a broad market-size headline. [D1]

Product. The invented reference packet includes a working integration and workflow logs supporting a reduction in exception-handling time. Product value is specific and deployment is manageable. The assessment does not assume that the same results hold across every ERP or customer size; broader implementation repeatability remains a limitation. [D1]

Traction. An invented customer-level schedule supports EUR 600,000 of recurring revenue and reconciles contracted and live accounts. Collections and customer references support current adoption. Only one renewal cycle has occurred, so the assessment does not claim mature retention, durable expansion or a repeatable high-growth acquisition engine. [D1]

Unit Economics. The fictional cost schedule includes hosting, integration work and customer support and supports positive contribution margins. Sales are still founder-led, making a stable scaled CAC or LTV estimate premature. This factor is assessed against seed-stage delivery economics rather than fabricated mature SaaS ratios; the current cost burden is understood. [D1]

Defensibility. ERP integrations and embedded approval processes could create switching friction. A proprietary-data advantage is not independently established, and adjacent vendors can replicate feature-level workflows. This is a plausible evolving moat rather than a demonstrated category monopoly; the lower evidence strength remains visible rather than being hidden in an aggregate score. [D1]

Terms. The invented executed SAFE and cap table establish cap-based conversion, no senior preference leakage and a EUR 12m post-money entry basis for this fictional case. Reviewed manager terms establish the fee/carry basis. These are stipulated completed underwriting facts, not conditions left until after committing. The cheque needs no later participation. [D1]

Decision-Critical Diligence

> **I1 · Retention history is short** RISK
>
> The fictional packet supports one renewal cycle, not multi-year cohort durability. [D1]
>
> **Decision impact:** Short history limits certainty but is ordinary stage-appropriate venture risk; it does not block focused pursuit.
>
> **Evidence needed:** Regular cohort reporting as the business ages.
>
> Resolution: monitor · Quarterly monitoring
>
> **Reassessment trigger:** Reassess conviction if churn rises materially.

> **I2 · Feature replication remains possible** RISK
>
> Integration depth is promising; a durable data moat is not proven. [D1]
>
> **Decision impact:** Keep modest conviction on upside exits and monitor competitive wins.
>
> **Evidence needed:** Future win/loss reporting.
>
> Resolution: monitor · Quarterly monitoring
>
> **Reassessment trigger:** Material competitive price compression would weaken the thesis.

Top Questions for the Founder

1. Which retention metric will you include in your regular investor updates?

Evidence: A sample cohort-report format; this is a monitoring question, not a condition of commitment. · Linked issue I1

Ask only these primary questions now. A founder assurance is not verification; request the indicated evidence or a route to confirm it.

Deal Economics

Exit required for 10x net cash returned, using explicit valuation, fee, carry and dilution ranges. No cheque or exit probabilities are assumed.

Assumptions	Entry valuation	Fee	Carry	Dilution	Required equity exit
Lower required exit	EUR 12,000,000	4.0%	20%	30%	EUR 218,928,571
Midpoint assumptions	EUR 13,000,000	5.0%	20%	45%	EUR 305,095,694

Assumptions	Entry valuation	Fee	Carry	Dilution	Required equity exit
Higher required exit	EUR 14,000,000	6.0%	20%	60%	EUR 456,675,532

All figures are fictional. Entry and syndicate costs illustrate supplied terms; dilution is a stress range. Ten times net cash is an illustrative target, not a personal hurdle or forecast.

Illustrative cap-based post-money entry; required exit is distributable equity after debt/preferences. No follow-ons, taxes or probability forecast. Ranges do not establish achievable exits or commitment readiness.

2. Fictional FieldSense

Entirely fictional demonstration. Companies, metrics, sources and probabilities are invented; this is not a live investment recommendation.

Company Overview

FieldSense develops edge sensors for plant reliability teams to support industrial machine maintenance and reduce downtime. The fictional packet describes a prototype and paid-pilot interest, but does not establish repeat production orders or independently verified detection performance. The ongoing revenue model is not specified. [D1]

Decision Brief

Weighted score

3.7 / 5

Score coverage: 85% · Weighted average over scored factors; 85% of rubric weight assessed. Unscored factors excluded, not treated as zero: Unit Economics, Terms. Descriptive score; not a return prediction.

CONSIDER · Priority: Medium · Attention: No

An interesting prototype deserves limited follow-up; competing options and unresolved delivery costs reduce priority.

Attention: Below the follow-up attention threshold.

Commitment readiness: Diligence required. Verify before committing: Pilot versus binding revenue; Unverified field reliability; Delivery economics incomplete

Investment Case and Decision

Investment case. FieldSense addresses expensive industrial downtime with edge sensors intended to identify machine-maintenance needs. Reliability teams have a relevant budget, and a coherent prototype plus customer trial interest provide a credible starting point. If the product proves dependable and economic in serial production, it could become a useful recurring maintenance tool.

Evidence supporting the case. The fictional packet supports prototype existence and paid-pilot interest, and the founding team has relevant industrial experience. These are early signals, not evidence of repeatable production sales. The evidence is deliberately separated by source quality: the claimed revenue description conflicts with the supplied cancellable-trial schedule, and reliability remains company-reported.

Counterarguments and risks. The reported pilots do not yet establish binding repeat orders. Independent field-reliability results are missing, while the unit-cost schedule excludes calibration, support, warranty and working capital. Incumbent sensor vendors and machine OEMs compete for the same maintenance budget. The headline valuation therefore cannot yet be supported by verified revenue or delivered margins.

Why this recommendation; what could change it. Pursuit priority reflects the value of further work at the current price and the evidence appropriate to this stage. Focus on the highest-impact customer and delivery questions. This screening does not authorize commitment or require mature operating metrics before a founder meeting.

Next action: Request the delivered unit-cost schedule before scheduling broader diligence.

Return analysis unavailable. The investor profile has no complete cheque range; no hypothetical ticket was assumed.

Seed · Post-money SAFE · EUR 20m post-money SAFE cap; fee/carry basis not available.

Market timing: Factory downtime creates measurable maintenance budgets, but sensor suppliers and machine OEMs already compete for those buyers.

Evidence as of 2026-10-03 (fictional)

Qualitative investment judgment; no personal return hurdle supplied

Seven-Factor Assessment

Category	Weight	Score / 5	Evidence strength	Key driver
Team	25%	4.2	Medium	Industrial experience; serial delivery leadership incomplete
Market	20%	4.1	Medium	Funded downtime problem; incumbent suppliers compete
Product	15%	3.4	Low	Coherent prototype; independent reliability evidence absent
Traction	15%	2.8	Low	Pilot interest established; recurring orders not verified
Unit Economics	10%	Not scored	Unknown	Full delivery cost and working capital unknown
Defensibility	10%	3.1	Low	Integration potential; proprietary advantage not demonstrated
Terms	5%	Not scored	Unknown	Headline cap known; security economics incomplete

Evidence strength: High = key claims independently corroborated by authoritative evidence; Medium = some corroboration, with material gaps; Low = evidence is mostly reported, incomplete or conflicting; Unknown = evidence quality could not be assessed. Unknown is not a negative score.

Weighted score across scored factors: 3.7 / 5 · Score coverage: 85%. Unscored factors are excluded, not treated as zero; scores are descriptive and do not determine the recommendation.

Team. The invented founders have industrial-sensing and machine-maintenance experience, with a credible prototype-delivery record. Manufacturing leadership remains a hiring need. Relevant domain knowledge supports the score, but it cannot verify the commercial or performance claims addressed by the separate blockers. [D1]

Market. Industrial downtime is a clear and expensive customer problem. Reliability teams control relevant budgets, creating an accessible wedge. Existing sensor vendors and machine OEMs compete for that budget, so a large manufacturing market does not by itself establish adoption or distribution advantage. [D1]

Product. A coherent sensor prototype exists in the invented packet, but company performance claims lack independent field evidence. The score recognizes specific product design while withholding stronger performance judgment. Reliability verification is an investment blocker rather than a post-cheque learning exercise. [D1]

Traction. Customer trial interest is supported in the fictional schedule, but the memo's recurring-revenue description conflicts with cancellable-pilot terms. The score reflects the weaker confirmed commercial status. Executed recurring contracts must reconcile that difference before the current price can be underwritten. [D1]

Unit Economics. The invented packet lacks calibration, support, warranty and production working-capital costs. A bill of materials cannot establish delivered margin, and the missing cost bridge prevents a defensible score. This is explicitly unscored rather than represented by an arbitrary low rating. [D1]

Defensibility. Machine integration could create workflow dependence and improve the product over time. The fictional evidence does not establish proprietary data rights, a patent advantage or superior customer access. Potential moat mechanisms therefore remain modest and low confidence rather than an assumed durable monopoly. [D1]

Terms. A EUR 20m headline post-money cap is supplied, but conversion and investor-specific costs are incomplete. Without a reviewed instrument and manager cost schedule, the net economic exposure cannot be evaluated. This factor remains unscored and the return model unavailable; questions on manager economics are routed to the manager. [D1]

Decision-Critical Diligence

> **I1 · Pilot versus binding revenue** BLOCKER
>
> The invented memo labels pilots as recurring revenue; the supplied schedule labels them cancellable trials. [D1]
>
> **Decision impact:** The current price cannot be underwritten from trial revenue.
>
> **Evidence needed:** Customer-by-customer recurring revenue schedule and executed agreements.
>
> Resolution: document · During initial diligence
>
> **Reassessment trigger:** Verified paid recurring contracts support the stated operating plan.

> **I2 · Unverified field reliability** BLOCKER
>
> Detection performance is claimed by the company but not supported by customer test results. [D1]
>
> **Decision impact:** Repeat production orders depend on dependable field performance.
>
> **Evidence needed:** Independent test report or a route to confirm results with a pilot customer.
>
> Resolution: document · During initial diligence
>
> **Reassessment trigger:** Customer-side evidence supports the defined operating requirements.

> **I3 · Delivery economics incomplete** BLOCKER
>
> Unit cost excludes calibration, warranty, support and working capital. [D1]
>
> **Decision impact:** Revenue growth may require unattractive capital consumption.
>
> **Evidence needed:** All-in unit-cost and production working-capital schedule.
>
> Resolution: document · During initial diligence
>
> **Reassessment trigger:** Early deliveries support contribution margin after full delivery costs.

Top Questions for the Founder

1. Can you share a customer-by-customer bridge from pilots to contracted recurring revenue?

Evidence: Revenue schedule linked to redacted executed customer agreements. · Linked issue I1

2. Which independent field-test report supports the reliability claim?

Evidence: Test report or an introduction to the pilot customer to confirm performance. · Linked issue I2

3. Can you share the fully loaded economics of one serial-production unit?

Evidence: Unit-cost schedule including calibration, support, warranty and working capital. · Linked issue I3

Ask only these primary questions now. A founder assurance is not verification; request the indicated evidence or a route to confirm it.

3. Fictional SidecarData

Entirely fictional demonstration. Companies, metrics, sources and probabilities are invented; this is not a live investment recommendation.

Company Overview

SidecarData provides prospect-data enrichment software for small B2B sales teams. Its workflow helps those teams enrich sales prospect records. The fictional customer schedule describes early paid accounts and known delivery costs. Established datasets and bundled CRM tools serve the same buyers; the packet does not specify the pricing model. [D1]

Decision Brief

Weighted score

3.4 / 5

Score coverage: 100% · All rubric weight assessed. Descriptive score; not a return prediction.

PASS · Priority: Low · Attention: No

The current terms have unattractive net economics.

Attention: No follow-up attention: the opportunity is declined or blocked by a hard risk.

Commitment readiness: Cannot assess readiness. Opportunity declined: The current terms have unattractive net economics.

Investment Case and Decision

Investment case. SidecarData provides a useful prospect-data enrichment workflow to small B2B sales teams. The fictional customer schedule supports early paid accounts, and known delivery costs allow a positive contribution margin. The product addresses an existing budget and the team has shipped data products, so the underlying business has credible strengths.

Evidence supporting the case. The invented packet contains paid recurring accounts, collected revenue, useful product performance and a cost schedule covering hosting, licensing and support. It supports a functioning early business with positive delivery economics. Acquisition remains founder-led, however, and customer expansion is modest; these facts support a viable company, not a category-leading growth outcome.

Counterarguments and risks. Prospecting data is crowded by established providers and CRM bundles, which constrain differentiation and pricing. Proprietary coverage and durable data rights are not established. More decisively, the EUR 60m post-money entry cap plus disclosed expenses and carry consumes most of the modeled base-case value; the return depends on a substantially larger exit over a long hold.

Why this recommendation; what could change it. The disclosed price and costs leave too little plausible upside for this investor. Further verification of ordinary operating claims would not resolve the pricing objection. Decline the current opportunity and reconsider only if the economics materially change.

Next action: Decline the current opportunity; reconsider only if the stated objection changes.

Seed · Post-money SAFE · EUR 60m post-money SAFE cap; expenses 4%, carry 20%.

Market timing: Sales teams buy prospect data, but established datasets and bundled CRM tooling constrain pricing power.

Evidence as of 2026-10-03 (fictional)

Qualitative investment judgment; no personal return hurdle supplied

Seven-Factor Assessment

Category	Weight	Score / 5	Evidence strength	Key driver
Team	25%	3.7	Medium	Capable operators; repeat scaling not established
Market	20%	3.5	Medium	Existing spend; crowded data category limits pricing
Product	15%	3.8	Medium	Useful enrichment workflow; performance reasonably supported
Traction	15%	3.4	Medium	Early recurring accounts; expansion modest
Unit Economics	10%	3.6	Medium	Delivery margin positive; paid acquisition not scaled
Defensibility	10%	2.8	Low	Data overlap and bundling weaken durable advantage
Terms	5%	1.5	Medium	High entry price leaves weak net base outcome

Evidence strength: High = key claims independently corroborated by authoritative evidence; Medium = some corroboration, with material gaps; Low = evidence is mostly reported, incomplete or conflicting; Unknown = evidence quality could not be assessed. Unknown is not a negative score.

Weighted score across scored factors: 3.4 / 5 · Score coverage: 100%. Unscored factors are excluded, not treated as zero; scores are descriptive and do not determine the recommendation.

Team. The fictional operators have shipped data products and recruited an initial technical team. Customer acquisition beyond founder-led sales remains limited. Team quality is serviceable and does not cause the PASS; the important distinction is that capable people do not automatically make an expensive security attractive. [D1]

Market. Prospecting data has established buyers and budget, with demand supported by the invented customer interviews. Mature datasets and bundled CRM tools restrict differentiation and price. The accessible market is credible, but the category is neither uniquely open nor supported by unlimited customer willingness to pay. [D1]

Product. The invented packet supports a functioning enrichment workflow and useful accuracy against defined customer requirements. Integrations fit existing sales processes. Product utility is a genuine strength in this illustration; it does not establish the large future equity value required by the current entry price. [D1]

Traction. Recurring paid accounts and collections are supported in the fictional customer schedule. Growth and expansion are modest rather than category-leading. This supports a functioning early business, while leaving the larger outcomes used in the stress tests explicitly contingent on a demanding future operating path. [D1]

Unit Economics. Known hosting, licensing and support costs permit a positive delivery contribution in the invented accounts. Paid acquisition has not reached stable scale. The available economics are plausible for stage, without fabricated LTV precision or a claim that every channel can be scaled profitably. [D1]

Defensibility. Customers can buy overlapping data from established providers, while workflow bundling makes switching between enrichment suppliers feasible. Proprietary coverage may help individual accounts, but the invented evidence does not establish durable data exclusivity or a compounding network effect. [D1]

Terms. The invented executed terms are clear enough to model: EUR 60m post-money entry plus disclosed costs and carry. Their transparency does not rescue their attractiveness. Against the stated operating paths, the net base payoff is modest over eight years and highly exposed to downside, so current pricing defeats the opportunity. [D1]

Decision-Critical Diligence

> **I1 · Entry price consumes upside** RISK
>
> The fictional entry cap requires a very large exit merely to create a modest base-case return. [D1]
>
> **Decision impact:** The current net risk/reward does not justify the opportunity.
>
> **Evidence needed:** Materially revised terms, not additional founder questionnaires.
>
> Resolution: monitor · Quarterly monitoring
>
> **Reassessment trigger:** Reopen only if a lower price changes the modeled outcomes.

Top Questions for the Founder

No additional founder questions needed now; do not fill a quota.

Ask only these primary questions now. A founder assurance is not verification; request the indicated evidence or a route to confirm it.

Deal Economics

Exit required for 10x net cash returned, using explicit valuation, fee, carry and dilution ranges. No cheque or exit probabilities are assumed.

Assumptions	Entry valuation	Fee	Carry	Dilution	Required equity exit
Lower required exit	EUR 12,000,000	4.0%	20%	30%	EUR 218,928,571
Midpoint assumptions	EUR 13,000,000	5.0%	20%	45%	EUR 305,095,694
Higher required exit	EUR 14,000,000	6.0%	20%	60%	EUR 456,675,532
